## CHARACTER GENERICUS.

*Dentes primores inferiores subulati.*

*Lin. Syst. Nat.* p. 79.

## CHARACTER SPECIFICUS, &c.

MUS cauda elongata floccosa, femoribus longissimis, digito utrinque spurio ad pedes posticos.

CUNICULUS pumilio saliens, cauda anomala longissima.

*Brisson Quadr.* 103.

JERBOA.

*Shaw Itin.* 248.

---

Mira pedum anticorum et posteriorum inæqualitate distinguitur Jerboa: antici enim ita breves sunt ut ad progrediendum minime valeant, postici autem totius corporis longitudini pares sunt. Hinc fit ut pedibus solummodo posterioribus stet et quiescat, anticosque ad nullum alium usum convertat, quam ad attrahendum cibum, culmos nempe cum spicis tritici, aliasque plantas; aut ad fodiendum cubile subterraneum. Plerumque more avis incedit, erecta scilicet cruribus, quæ pilis rarissimis vestiuntur, aviumque cruribus sunt

Q

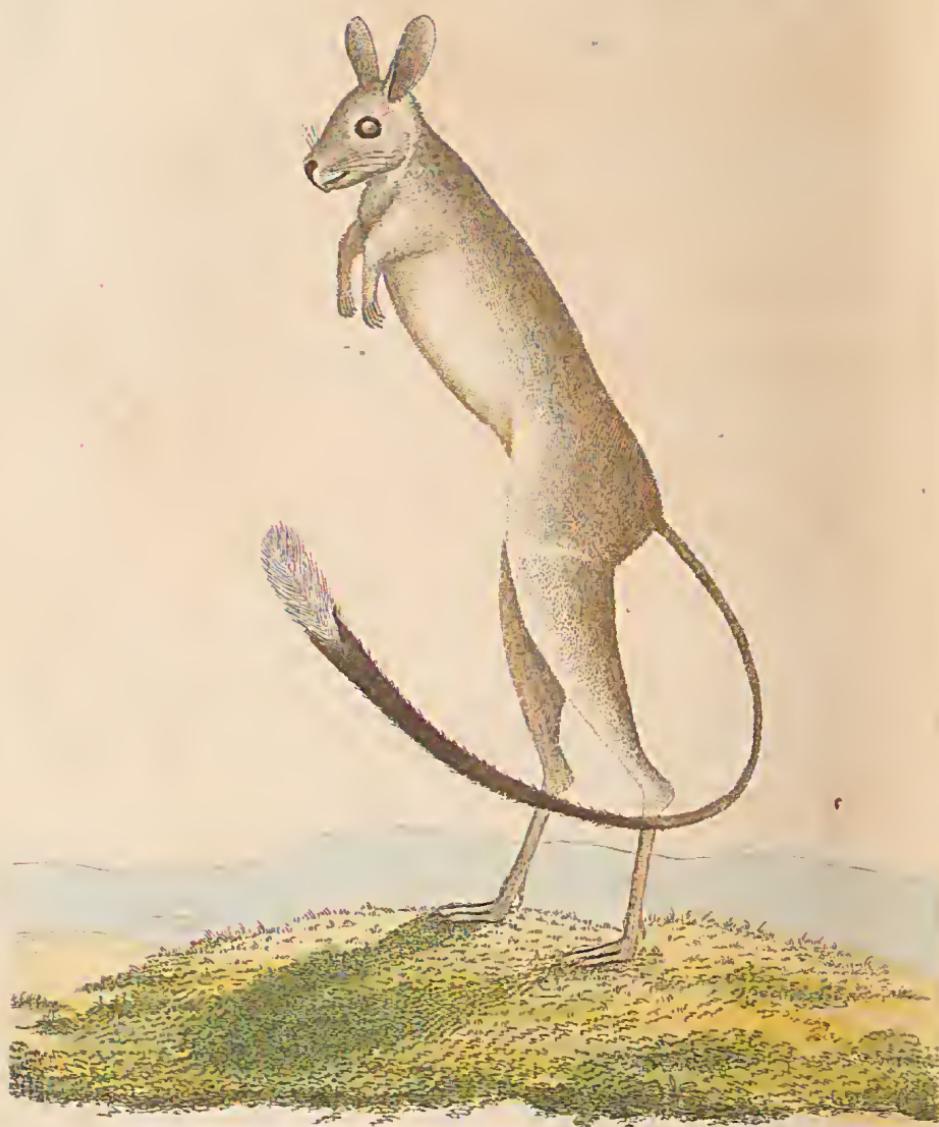

valde

valde similia. Cauda illi praelonga est, apice fasciculato.

Tres vel quatuor exstant Jerboæ species, vel saltem constantes, ut dicuntur, varietates, quæque in PENNANTII Historia Quadrupedum, genus distinctum constituant; quas vero LINNÆUS, sub genere *Muris* ordinat.

Pernicissimæ velocitatis sunt Jerboæ, et ab hoste saltibus continuatis longissimis adeo rapide aufugiunt, ut equo generoso vectus aliquis vix ægreque illas assequi possit. Frigoris sunt impatientes, et tempore brumali in domunculis subterraneis sepultæ obdormiunt. Fru-gibus vescuntur. In hoc potissimum differt species de qua jam agitur a communi specie, (quæ *Mus Jaculus* LINNÆI) quod crura paulo supra pedes digito utrinque spurio, longo, velut calcari armantur. Non tantum calidas regiones, Syriam nempe et Barbariam, sed et Sibiriae partes orientales, idque frequenter, incolit Jerboa. Moles illi est quasi magni soricis..

THE  
SIBIRIAN JERBOA.

---

*GENERIC CHARACTER.*

Two long cutting teeth in each jaw.  
*Fore Legs* very short: hind legs very long.

*SPECIFIC CHARACTER, &c.*

JERBOA with a pair of spurious toes on each hind foot.

SIBIRIAN JERBOA.

*Pennant Quadr.* p. 429.

---

The Jerboa is remarkable for the strange disproportion between the length of the fore legs and the hind ones; the former being so very short as to be of no use to the animal in walking, while the latter are so long as to equal the whole body. In consequence of this peculiar formation, the creature stands and rests on its hind legs only, and makes no other use of the fore legs than to hold its food, and draw down the stems of wheat and other vegetables on which it feeds, and to scratch the ground in order to form its burrows. It has the general actions and attitudes of a bird, and the legs are covered thinly with short hair, and very much resemble those of birds. The tail is very long and terminates in a tuft.

There are three or four distinct species, or at least permanent varieties of Jerboa, and in the History of Quadrupeds of MR. PENNANT they constitute a particular genus; but LINNÆUS places them as species of the genus *Mus*.

The Jerboas are animals of the most surprizing swiftness, and on the approach of danger immediately spring forward by successive leaps, so very nimbly, that it is said to be very difficult for a man well mounted to overtake them. They are impatient of cold, and remain during the winter in a dormant state in their burrows. They feed on vegetables. The particular species here represented differs principally from the common Jerboa or *Mus Jaculus* of LINNÆUS in having the legs furnished at a little distance above the feet with a pair of spurious toes or spurs. It is found not only in the warmer regions of Barbary and Syria, but in the Eastern part of Siberia in considerable plenty. It is about the size of a large rat.
